

Progetto Comenius "Nemo"

multilaterale sulla mobilità degli studenti

Servizi per la Valutazione

Sergio Cecchini, AnnaMaria Gilnerti, Paco Navarro, Anna Riva

Questo progetto biennale, in fase di conclusione, ha coinvolto 5 istituti:
con gruppi di studenti che hanno
partecipato a 4 settimane di mobilità
nelle varie sedi degli istituti.

Kiuruveden Lukio Kiuruvesi (Finland)

Matematica Senza Frontiere

Ogni sessione è stata caratterizzata da

- ❖ condivisione di vita scolastica, familiare, dell'ambiente con presentazione di studi e ricerche (in lingua comune inglese)
- ❖ esercitazione in gruppi per la risoluzione di esercizi nello spirito di MsF
- ❖ esposizione in lingua comune (inglese) del prodotto di studio e ricerca negli ambiti (in successione nelle varie fasi) delle Simmetrie

Not symmetric ...

GRANADA

della **Statistica**:
da Kiuruvesi, poi nelle varie città, monitoraggio dei
prezzi

della **Statistica**:

interviste ai Christmas Market di Strasburgo

della modellizzazione in 3D di cui oggi vi presentiamo due flash:

- il modello costruito dagli studenti dell'ITT di Foligno del **Mondo visto da Dante nella "Divina Commedia"** (1307 – 1321) su idea del prof. Sergio Cecchini (2010 - 2011)

Figure a 3 dimensioni

nel mondo reale

...

ma non solamente le forme in tre dimensioni: coni, sfere, cilindri, piramidi, prismi ...

Esistono, inoltre, figure meno note, generate da superfici regolari.

L'insegnante ha mostrato agli studenti dei disegni tridimensionali ed è stato loro chiesto d'individuare un oggetto reale che assomigliasse.

In seguito si è ricercata l'espressione matematica (in genere basata su rapporti trigonometrici) descrittiva della figura.

Qual è la superficie che origina
questo 3D ?

Superficie ruotante attorno a una cicloide allungata

Descrizione

Curva piana parametrata da:

$$f[a,b](u) = (a u - b \sin[u], a - b \cos[u])$$

E' la curva dei punti sul piano che descrivono una circonferenza di raggio b quando una circonferenza di raggio a ruota senza scivolare lungo una retta fissa con $a < b$

Qual è la superficie che origina questo 3D ?

Superficie ruotante attorno una epicicloide

Qual è la superficie che origina questo 3D ?

La lemniscata di Bernoulli

In architettura molti sono gli esempi.
Vi sono molti elementi matematici-geometrici,
come fregi, mosaici, coni, simmetrie, archi,...

Un esempio evidente si trova a Grenade,
l'Alhambra et Generalife.
Ecco un modello 3D

Uno degli strumenti utili per
costruire figure 3D è la
programmazione informatica.
Sono presentati esempi con l'utilizzo di
Cabri.

Palazzo Carlos V realizzato con il programma CABRI 3D

esempio di **esercitazione di gruppo** fondata
sull'idea che non basta studiare sui libri

Il libraio - Arcimboldo, 1566 circa

- esempio tratto dalla **esercitazione** effettuata presso IES RABULEILA(Granada) con modelli di legno predisposti dal prof.Paco Navarro (2011)

The snake

The labyrinth of the snake consists of 27 cubes internally united by an elastic cord. When unrolled and flat, it looks like a snake. The challenge is to get all the pieces form a cube.

difficulty: high

The Magic Frame

Claudia and Letizia mount four pieces of wood to build a frame. They tag the four sides of each piece of wood with a number from 1 to 16. Claudia says: “Look, it’s magic! The sum of the numbers written on the four sides of each piece is 34”.

Letizia takes the frame and disassembles it as show in Figure. Then, she says: “There is something better! If I sum the numbers of the four top trapezoids or even the bottom ones of the external sides or even the internal ones or also the four sides having a vertex in common, I always obtain 34”.

difficulty: medium
